

the editorship of B. Lewis, R. N. Pease, and H. S. Taylor covers experimental techniques in combustion. Chapter headings give a good idea of the scope of this work. The first part comprises: "Density measurements," "Pressure measurements," "Velocity measurements," "Temperature measurements," "Shock front measurements by light reflectivity," "Turbulence measurements," "Condensation study by absorption or scattering of light," and "Analogue methods." The second part consists of chapters on: "Measurement of flame temperature, pressure and velocity," "Flame photography," "Measurement of burning velocity," "Mass spectroscopy," "Spectroscopy of combustion," and "Analysis of the combustion wave by pressure effects and spectroscopy." These chapters are by leading investigators in the respective fields: A. B. Arons, J. W. Beams, D. Bershader, W. Bleakney, F. P. Bundy, W. M. Cady, P. M. Chambré, G. H. Dieke, G. R. Eber, E. F. Fiock, J. A. Hipple, D. F. Hornig, L. S. G. Kovaszny, R. Ladenburg, L. Malavard, W. T. Reid, S. A. Shaaf, A. H. Shapiro, H. M. Stroug, N. Thomas, F. J. Weyl, and E. M. Winkler. The writing is authoritative; the difficulties encountered in making various measurements and the devices by which these difficulties have been overcome or reduced are well presented. A good balance is maintained between the discussions of the principles of the methods used and the descriptions of experimental details. Numerous drawings and halftone plates make it easy to follow presentations. The articles are well referenced throughout and while the reference lists make no claim to exhaustiveness, they seem to have been well chosen and to be entirely adequate.

As is probably unavoidable in a cooperative undertaking of this nature, some duplication and lack of uniformity are noticeable occasionally. Thus the schlieren method and the Mach-Zender interferometer are discussed in both parts of the volume, the second presentation adding little that is not covered by the first. Some comparatively simple techniques are given more space than really necessary although this space could have been advantageously used to describe the more sophisticated methods in greater detail. The reviewer questions a few of the statements made, for instance some of those about active nitrogen (pp. 79-81) or the remark (p. 345) that sound velocity measurements in flames give translational temperature regardless of equilibrium with other degrees of freedom. Such weaknesses, however, are few in number and are not important, since on the whole the volume is extremely well written and gives the reader a clear view of the present status of experimental techniques, as well as preparing him for the study of original literature.

Legibly and attractively printed, this volume should be required reading for all those preparing to undertake research in the important area of physical sciences covered by this series.

*Genetic Homeostasis.* I. Michael Lerner. Wiley, New York; Oliver & Boyd, London, 1954. vii + 134 pp. Illus. + plates. \$3.25.

In this small volume, the author has undertaken to demonstrate that Mendelian populations have self-regulatory properties, that this genetic homeostasis is related to the better-known developmental homeostasis, and that heterozygosity furnishes a common basis for both phenomena. In developing this thesis, a number of seemingly unrelated lines of evidence are cleverly selected and woven into an extremely convincing argument. The result is probably the most important recent contribution to the literature of population genetics.

Individuals of all species—perhaps to a greater extent among those that are cross-fertilizing—possess regulatory mechanisms that buffer developmental processes against capricious environmental fluctuations. Lerner, through a study of the data bearing on the relation of genotype to environmentally caused phenotypic variation, concludes that heterozygous individuals of a cross-fertilizing species have buffering capacities superior to those of homozygous individuals and, hence, possess "normal" phenotypes more frequently than do the latter. The consequences of this simple hypothesis for populations are far reaching: on the average, heterozygous individuals are favored by selection. Selection, not simple mutation pressure, is primarily responsible for maintaining the genetic variability within populations; the greater the variability, the greater the proportion of heterozygous individuals, and the greater the average fitness of the population. A program of selection, insofar as its aims are met by homozygosity, may be brought to a halt through an unsuspected counterselection for heterozygosity long before the genetic variability of the selected population is exhausted. Responses by populations to novel demands of natural selection are more rapid than they are usually assumed to be under a "homozygous individual" model. In spite of this ability to make rapid responses, the population preserves the ability to revert to its original state (or its equivalent) if the novel demands prove short lived.

As experimental evidence accumulates, details of the arguments presented in this essay will doubtlessly undergo modification. It may be, for instance, that the term *heterozygous* has been used in an operational rather than in a definitive sense. The rather long discussion concerning the pleiotropic effects of genes may eventually appear unduly cautious. Nevertheless, the main argument represents a refreshing approach to problems facing students of both natural and artificial selection; these would do well to take seriously the admonition of the epigraph: "Read not to contradict nor to believe but to weigh and consider."

*Improving Animal Welfare through Genetic Selection* Wendy Mercedes Rauw, 2016-07-12

In livestock species breeding goals are aimed primarily at improvement of production traits. However, there are a number of examples where selection for high production efficiency has resulted in reduced welfare through unfavorable outcomes in health and fitness characteristics. These effects raise questions about what is ethically acceptable in animal breeding. Welfare problems may be experienced when physiological balance is disturbed by genetic selection for high production alone by a mismatch between the environmental challenges and the range of coping responses available to an animal or from a mismatch between the animal's needs and their degree of satisfaction. This may be resolved by either improving the environment to support the animal but also by providing the animal through genetic selection with means to adapt to the production environment. The Standing Committee of the European Convention for the Protection of Animals kept for Farming Purposes emphasizes that breeding goals should include health and welfare. The Farm Animal Welfare Council pleads for a greater emphasis in breeding programs on traits associated with good welfare. However, although breeding goals in most farm animal species have been broadened beyond production traits to include functional traits, behavioral traits are rarely included despite their potential to improve animal production and welfare. It is the goal of the present Research Topic to bring together experimental and theoretical research focusing on the genetics of welfare traits and the possibility to improve animal welfare through selection. This topic presents an overview of the relationship between selection for high production and livestock robustness, examples of improving robustness through the introduction of novel traits in livestock breeding and a discussion on selection methods to address welfare issues. The discussion on sustainability of breeding practices is very alive today and will remain to be an important part of the debate in the future.

#### **The Geomagnetic Field and Life A.**

Dubrov, 2013-11-11 I am very pleased that my book *The Geomagnetic Field and Life* is being published in English in the United States. Thanks to the initiative of Plenum Press, a publishing house that is widely known in all countries, I have a great new opportunity to make direct contact with friends throughout the world. My book on the geomagnetic field can be regarded as an abstraction whose purpose is to provide a better picture and understanding of the world around us, its main driving forces and factors to help us to know ourselves and to proceed further. The essence of the abstraction is that in treating the problem, I have deliberately ignored the diverse effects of various external factors on living organisms and have confined myself to an analysis of the effect of the GMF. This approach allows me to go one step further to draw various conclusions and propose theories that might bring us closer to a proper understanding of the true nature of the phenomena. Philosophers have long been aware that by such abstract thinking we can determine the nature of phenomena more reliably, completely and comprehensively, penetrate to the very core of the observed effects and perceive the depth of their interrelations.

PLANT BREEDING METHODS RAM, MAHABAL, 2014-10-01 This comprehensive book provides a detailed account of the plant breeding methodology covering particularly pre and post Green Revolution era. It elaborates on plant breeding and gene manipulation, utilization of self-incompatibility in developing hybrids, different plant breeding methods for development.

of crop varieties and hybrids in self and cross pollinated crops nature of gene action and genotype environment interaction The text discusses gene manipulation in the crop plant and transfer of genes from wild species to cultivated crops application of biotechnology in plant breeding and genetic engineering and transgenic molecular markers as breeding tools and their limitations It concludes with a discussion on physiologic breeding approach and new plant ideotype concepts which are new and emerging areas of interest in plant breeding research The book will be of immense use to undergraduate and postgraduate students of Agricultural Sciences and Botany for their course study Besides research scholars and professionals will also find the book as an excellent source of reference **Genetic Homeostasis** Isadore Michael Lerner,1970
