

Genetics of Prokaryotes and Eukaryotes

Genetic information is contained in chromosomes. In prokaryotes, the DNA is contained in a single circular chromosome. In eukaryotes, the DNA is contained in multiple linear chromosomes. The chromosomes are contained in the nucleus.

Prokaryotic Cell Structure

Cells of a prokaryote are usually very small, and they lack a nucleus. They are divided into two main groups: bacteria and archaea.

Archaea are different in many ways from bacteria. They are often found in extreme environments, and they have unique characteristics. They are also very small, and they lack a nucleus.

Prokaryotic Cell Reproduction

There is only one type of cell division in prokaryotes, called binary fission. In binary fission, the cell replicates its DNA and then divides into two daughter cells.

Eukaryotic Cell Reproduction

Eukaryotes have a more complex cell structure. They have a nucleus, and their DNA is contained in multiple linear chromosomes. They also have a cell membrane and a cell wall.

There are two types of cell division in eukaryotes: mitosis and meiosis.

Mitosis is a type of cell division that results in two daughter cells that are genetically identical to the parent cell. Meiosis is a type of cell division that results in four daughter cells that are genetically diverse.

The two types of cell division are different. Mitosis is a type of cell division that results in two daughter cells that are genetically identical to the parent cell. Meiosis is a type of cell division that results in four daughter cells that are genetically diverse.
