Geometric Methods in System Theory In automatic control there are a large number of applications of a fairly simple type for which the motion of the state variables is not free to evolve in a vector space but rather must satisfy some constraints Examples are numerous in a switched lossless electrical network energy is conserved and the state evolves on an ellipsoid surface defined by $x^T Q x$ equals a constant in the control of finite state continuous time Markov processes the state evolves on the set $x \times 1 \times 0$ The control of rigid body motions and trajectory control leads to problems of this type There has been under way now for some time an effort to build up enough control theory to enable one to treat these problems in a more or less routine way It is important to emphasise that the ordinary vector space linear theory often gives the wrong insight and thus should not be relied upon The Stability of Solar System and of Small Stellar Systems Yoshihide Kozai, 1974-09-30 Proceedings of IAU Symposium No 62 held in Warsaw Poland September 5 8 1973 An Index and Other Useful Information A.
