- What does elasticity measure? How does it change? What are the factors that affect it? How is it related to the demand curve? How is it related to demand's steepness? How is it related to demand's steepness? How is it related to demand's steepness?
- Definition: Elasticity is a numerical measure of the responsiveness of Q^D or Q^S to a change in P .

Price Elasticity of Demand

- Price elasticity of demand measures how much Q^D responds to a change in P .
- It measures the price sensitivity of buyers' demand.

$$\text{Price elasticity of demand} = \frac{\text{Percentage change in } Q^D}{\text{Percentage change in } P}$$

Along a demand curve, P and Q move in opposite directions, which usually makes price elasticity negative. We will drop the minus sign and report absolute values of price elasticity.

Example:

The price elasticity of demand is -0.5. This means that a 1% increase in price causes a 0.5% decrease in quantity demanded.

Calculating Percentage Changes

Price falls from \$10 to \$9, a change of -10%.

Quantity falls

from 100 to 90, a change of -10%.
