**Fractional Programming** I.M. Stancu-Minasian,2012-12-06 Mathematical programming has known a spectacular diversification in the last few decades This process has happened both at the level of mathematical research and at the level of the applications generated by the solution methods that were created To write a monograph dedicated to a certain domain of mathematical programming is under such circumstances especially difficult In the present monograph we opt for the domain of fractional programming Interest of this subject was generated by the fact that various optimization problems from engineering and economics consider the minimization of a ratio between physical and or economical functions for example cost time cost volume cost profit or other quantities that measure the efficiency of a system For example the productivity of industrial systems defined as the ratio between the realized services in a system within a given period of time

and the utilized resources is used as one of the best indicators of the quality of their operation. Such problems where the objective function appears as a ratio of functions constitute fractional programming problem. Due to its importance in modeling various decision processes in management science, operational research and economics and also due to its frequent appearance in other problems that are not necessarily economical such as information theory, numerical analysis, stochastic programming, decomposition algorithms for large linear systems etc, the fractional programming method has received particular attention in the last three decades. Linear-Fractional Programming Theory, Methods, Applications and Software E.B. Bajalinov, 2013-12-01. This is a book on Linear Fractional Programming here and in what follows we will refer to it as LFP. The field of LFP largely developed by Hungarian mathematician B Martos and his associates in the 1960s is concerned with problems of optimization. LFP problems deal with determining the best possible allocation of available resources to meet certain specifications. In particular they may deal with situations where a number of resources such as people, materials, machines and land are available and are to be combined to yield several products. In linear fractional programming the goal is to determine a permissible allocation of resources that will maximize or minimize some specific showing such as profit gained per unit of cost or cost of unit of product produced etc. Strictly speaking linear fractional programming is a special case of the broader field of Mathematical Programming. LFP deals with that class of mathematical programming problems in which the relations among the variables are linear, the constraint relations i.e. the restrictions must be in linear form and the function to be optimized i.e. the objective function must be a ratio of two linear functions.

When it comes to optimization techniques in some cases the available information from real models may not be enough to construct either a probability distribution or a membership function for problem solving. In such cases there are various theories that can be used to quantify the uncertain aspects. *Optimization Techniques for Problem Solving in Uncertainty* is a scholarly reference resource that looks at uncertain aspects involved in different disciplines and applications. Featuring coverage on a wide range of topics including uncertain preference, fuzzy multilevel programming and metaheuristic applications, this book is geared

towards engineers managers researchers and post graduate students seeking emerging research in the field of optimization
