

Thinner steel laminations  
decrease eddy current losses

More copper wire  
of larger diameter  
in the stator saves  
energy by reducing  
the resistance of the  
stator winding.

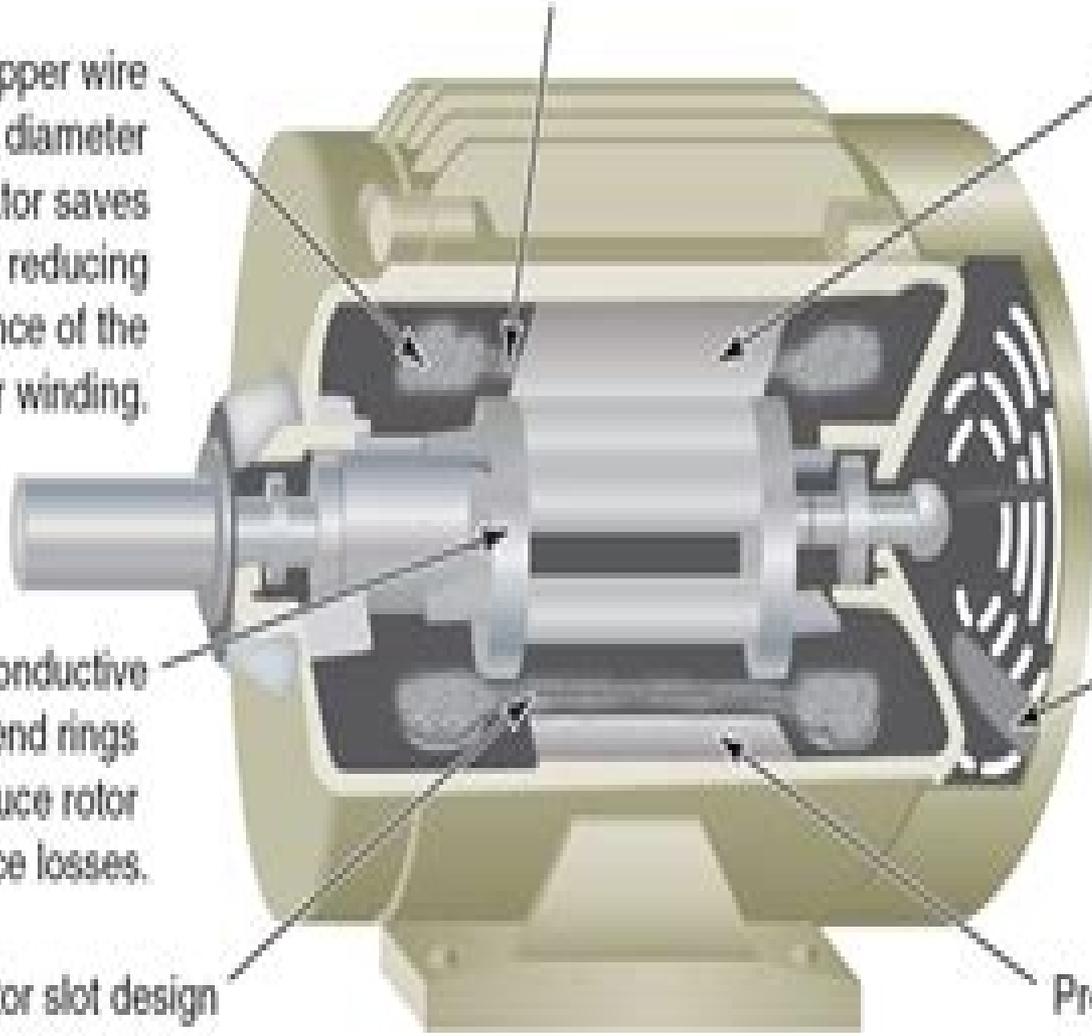

Longer stator lowers magnetic  
density and increases cooling  
capacity. As a result both  
magnetic and load losses are  
reduced.

Large conductive  
bars and end rings  
reduce rotor  
resistance losses.

Efficient cooling fan design  
improves air flow and reduces  
power required to drive fan.

Modified stator slot design  
helps to decrease magnetic  
losses and makes room for  
larger diameter wire.

Premium-grade steel core  
reduces hysteresis power losses.

*Energy Efficient Motors Reference Guide* Nadi D. Sadanandan, Ahmed H. Eltom, Tennessee Valley Authority, 2005-01  
Energy efficient motors are motors in which better quality parts increased conductor size higher quality steel and improved design are combined to produce motors with full load efficiencies higher than standard motors Energy efficient motors maintain high efficiency at low loads They usually have inherently higher power factors than standard motors and maintain higher power factors under partial load operations Energy efficient motor windings will generally have longer life than standard motor windings because they run cooler This motor reference guide is the result of data and information collected and organized by the Industrial and Large Commercial staff of the Tennessee Valley Authority Additionally computer simulations were performed to develop data not currently available in literature The guide is not intended to be a textbook on motors but a quick and ready reference to assist in the technical and economic evaluation of energy efficient motors versus standard motors However chapters on motor related topics such as rotating fields power factor correction and impact of power quality on motor performances have also been included to complement the text Motor Master User Guide ,1994
