Matlab - Modelling, Programming and Simulations Emilson Pereira Leite, 2010
Programming and Engineering Computing with MATLAB 2018 Huei-Huang Lee, 2018 This book is designed for undergraduate students completely new to programming with MATLAB Case studies and examples are used extensively throughout this book and are at the core of what makes this book so unique The author believes that the best way to learn

MATLAB is to study programs written by experienced programmers and that the quality of these example programs determines the quality of the book. The examples in this book are carefully designed to teach you MATLAB programming as well as to inspire within you your own problem solving potential. Most of the examples used in this book are designed to solve a whole class of problems rather than a single specific problem. A learn by doing teaching approach is used all through the book. You are guided to tackle a problem using MATLAB commands first and then the commands are explained line by line. This process of learning through hands on experience is one of the most efficient and pain free ways of learning MATLAB. This approach together with the extensive use of ordered textboxes figures and tables greatly reduces the size of the book while still providing you with a book that is comprehensive and easy to follow. The first chapter of this book introduces the MATLAB programming environment and familiarizes you with MATLAB's core functionality. Chapters two through nine discuss basic MATLAB functionalities in a progressive and comprehensive way. The chapters start out simple and build in complexity as you advance through the book. Chapters ten through thirteen cover advanced topics that are particularly useful in college programs. Each chapter consists of sections each covering a topic and providing one or more examples. Related MATLAB functions are organized at the end of a section. Additional exercise problems are provided at the end of chapters two through nine. Examples in each section are presented in a consistent way. An example is usually described first followed by a MATLAB script. Any resulting text and graphics output and in some cases inputs that are produced from running a script are presented and discussed. Finally the remainder of each section is devoted to explaining the purpose of the lines of the script.

This book begins with covering the fundamentals of MATLAB programming and applications and the solutions to different mathematical problems in simulation. The fundamentals of Simulink modelling and simulation are then presented followed by coverage of intermediate level modelling skills and more advanced techniques in Simulink modelling and applications. Finally the modelling and simulation of engineering and non engineering systems are presented. The areas covered include electrical electronic systems mechanical systems pharmacokinetic systems video and image processing systems and discrete event systems. Hardware in the loop simulation and real time application are also discussed. Key features: Progressive building of simulation skills using Simulink from basics through to advanced levels with illustrations and examples. Wide coverage of simulation topics of applications from engineering to non engineering systems. Dedicated chapter on hardware in the loop simulation and real time control. End of chapter exercises.
