## Field Guide To Algebra:

**A Field Guide to Algebra** Antoine Chambert-Loir, 2007-12-21 This is a small book on algebra where the stress is laid on the structure of fields hence its title You will hear about equations both polynomial and differential and about the algebraic structure of their solutions For example it has been known for centuries how to explicitly solve polynomial equations of degree 2 Baby nians many centuries ago 3 Scipione del Ferro Tartaglia Cardan around the 1500s and even 4 Cardan Ferrari 16th century using only algebraic operations and radicals  $n$ th roots However the case of degree 5 remained unsolved until Abel showed in 1826 that a general equation of degree 5 cannot be solved that way Soon after that Galois defined the group of a polynomial equation as the group of permutations of its roots say complex roots that preserve all algebraic identities with rational coefficients satisfied by these roots Examples of such identities are given by the elementary symmetric polynomials for it is well known that the coefficients of a polynomial are up to sign elementary symmetric polynomials in the roots In general all relations are obtained by combining these but sometimes there are new ones and the group of the equation is smaller than the whole permutation group Galois understood how this symmetry group can be used to characterize the solvability of the equation He defined the notion of solvable group and showed that if the group of the equation is solvable then one can express its roots with radicals and conversely
